1.1.1 Detailed Description

A structure used to represent the collection of settings pertaining to a particular channel or stage. Note that DPLib CNTL coefficient structures are handled separately to reduce complexity as DPLib expects them to be arranged in a certain manner in memory.

1.1.2 Field Documentation

1.1.2.1 `uint16 channelParameters::acFrequency`

Sine signal generator frequency setting (Hz).

1.1.2.2 `uint16 channelParameters::chEnable`

Channel enable status [FALSE | TRUE].

1.1.2.3 `ctrlType channelParameters::ctrlMode`

Control mode setting [iCtrl | vCtrl].

1.1.2.4 `int16 channelParameters::dGain`

CNTL D Gain (SQ8).

1.1.2.5 `volatile int32 channelParameters::iFdbkNet`

Current feednack net (IQ24).

1.1.2.6 `int16 channelParameters::iGain`

CNTL I Gain (SQ8).

1.1.2.7 `int16 channelParameters::iMaxRms`

Maximum RMS current setting limit (SQ10).

1.1.2.8 `int16 channelParameters::iMinRms`

Minimum RMS current setting limit (SQ10).

1.1.2.9 `int16 channelParameters::iScale`

Current scaling setting in volts-per-amp for scaling between a voltage level measured by an ADC to a real current value (SQ14).

1.1.2.10 `int32 channelParameters::ocp`

Normalised OCP limit (IQ24).

1.1.2.11 `opType channelParameters::opMode`

Output mode setting [dc | ac].

1.1.2.12 `float32 channelParameters::otp`

? deg C? 8-bit adc.

1.1.2.13 volatile int32 channelParameters::outNet

IIR filter control law output net (IQ24).

1.1.2.14 int32 channelParameters::ovp

Normalised OVP limit (IQ24).

1.1.2.15 int16 channelParameters::pGain

CNTL P Gain (SQ8).

1.1.2.16 volatile int32 channelParameters::refNet

Net for CNTL reference (IQ24).

1.1.2.17 int32 channelParameters::slewRate

IIR filter control law reference slew rate (IQ24).

1.1.2.18 int32 channelParameters::target

IIR filter control law reference slew target (IQ24).

1.1.2.19 volatile int32 channelParameters::vFdbkNet

Voltage feedback net (IQ24).

1.1.2.20 int16 channelParameters::vGainLmt

Sine signal generator voltage gain limit (SQ14).

1.1.2.21 int16 channelParameters::vMaxRms

Maximum RMS voltage setting limit (SQ10).

1.1.2.22 int16 channelParameters::vMinRms

Minimum RMS voltage setting limit (SQ10).

1.1.2.23 int16 channelParameters::vScale

Voltage scaling setting in volts-per-volts for scaling between a voltage level measured by an ADC to a real voltage value (SQ14).

The documentation for this struct was generated from the following file:

- [MacroNets.h](#)

1.2 i2cMsg Struct Reference

```
#include <I2c.h>
```

Data Fields

- volatile Uint16 [msgStatus](#)
- Uint16 [slaveAddress](#)
- Uint16 [numOfBytes](#)
- Uint16 [numSlavePtrBytes](#)
- Uint16 [slavePtrAddrHigh](#)
- Uint16 [slavePtrAddrLow](#)
- Uint16 [msgBuffer](#) [I2C_MAX_BUFFER_SIZE]

1.2.1 Detailed Description

The structure used to contain all settings and values relevant to a particular I2C message.

1.2.2 Field Documentation

1.2.2.1 Uint16 i2cMsg::msgBuffer[I2C_MAX_BUFFER_SIZE]

A buffer array for message data. The maximum buffer size, MAX_BUFFER_SIZE, is 4 due to the FIFO's size.

1.2.2.2 volatile Uint16 i2cMsg::msgStatus

Indicates which state the message is in.

1.2.2.3 Uint16 i2cMsg::numOfBytes

The number of valid bytes in (or to be put in msgBuffer).

1.2.2.4 Uint16 i2cMsg::numSlavePtrBytes

The number of slave register pointer address bytes.

1.2.2.5 Uint16 i2cMsg::slaveAddress

The slave device I2C address this message is intended for.

1.2.2.6 Uint16 i2cMsg::slavePtrAddrHigh

The slave register pointer high byte.

1.2.2.7 Uint16 i2cMsg::slavePtrAddrLow

The slave register pointer low byte.

The documentation for this struct was generated from the following file:

- [I2c.h](#)

2.1.1 Detailed Description

ADC, DAC, comparator and related functions.

2.1.2 Function Documentation

2.1.2.1 Uint16 adcCheckOcp (void)

Checks the current current sense ADC readings against the OCP limits.

Returns

Error status

2.1.2.2 Uint16 adcCheckOvp (void)

Checks the current voltage sense ADC readings against the OVP limits.

Returns

Error status

2.1.2.3 void adcCompConfigure (void)

Configures the COMP 1 & 2 comparators using the internal DACs at inverting inputs.

- SHOULD be called AFTER `adcSocCnf()`.
- SHOULD be called BEFORE PWMS (SYNC) are started.
- SHOULD be called BEFORE `pwmTZConfigure()`.

2.1.2.4 Uint16 adcGetIScale (Uint16 *chnl*, float32 * *sciDest*)

Queries the current current scaling setting of the specified channel.

Parameters

in	<i>chnl</i>	Specifies the channel number on which the setting is to be queried.
out	<i>sciDest</i>	Address of the memory location at which to place the query result (amps).

Returns

Error status.

2.1.2.5 Uint16 adcGetOcp (Uint16 *chnl*, float32 * *ocpDest*)

Queries the over current protection setting for the specified channel.

Parameters

in	<i>chnl</i>	Specifies the channel number on which the setting is to be queried.
out	<i>ocpDest</i>	Address of the memory location at which to place the query result (amps).

Returns

Error status.

2.1.2.6 Uint16 adcGetOvp (Uint16 *chnl*, float32 * *ovpDest*)

Queries the over current protection setting for the specified channel.

Parameters

in	<i>chnl</i>	Specifies the channel number on which the setting is to be queried.
out	<i>ovpDest</i>	Address of the memory location at which to place the query result (volts).

Returns

Error status.

2.1.2.7 Uint16 adcGetVScale (Uint16 *chnl*, float32 * *sclDest*)

Queries the current voltage scaling setting of the specified channel.

Parameters

in	<i>chnl</i>	Specifies the channel number on which the setting is to be queried.
out	<i>sclDest</i>	Address of the memory location at which to place the query result (volts).

Returns

Error status.

2.1.2.8 void adcMacroConfigure (void)

Configures the ADC's SOC's then calls [pwmSocConfigure\(\)](#).

- SHOULD be run after [pwmMacroConfigure\(\)](#).
- SHOULD be run before [DPL_INIT\(\)](#).

2.1.2.9 Uint16 adcSetDac (Uint16 *chnl*, float32 *dacLvl*)

Sets the output levels of the DACs on the inverting input of the comparators. The function will determine the scaling to be applied by testing the ctrlMode setting of the channel specified. The respective channel's current or voltage MUST be set previously.

Parameters

in	<i>chnl</i>	Specifies the channel number the setting is to be applied to.
in	<i>dacLvl</i>	Specifies the value of the level setting to be applied (volts or amps).

Returns

Error status.

2.1.2.10 Uint16 adcSetIScale (Uint16 *chnl*, float32 *scaleSetting*)

Sets the current scaling for the specified channel.

Parameters

in	<i>chnl</i>	Specifies the channel number the setting is to be applied to.
in	<i>scaleSetting</i>	Specifies the value of the scaling setting to be applied (amps/volts).

Returns

Error status.

2.1.2.11 Uint16 adcSetOcp (Uint16 *chnl*, float32 *ocpSetting*)

Sets the over current protection limit for the specified channel.

Parameters

in	<i>chnl</i>	Specifies the channel number the setting is to be applied to.
in	<i>ocpSetting</i>	Specifies the value of the limit to be applied (Amps).

Returns

Error status.

2.1.2.12 Uint16 adcSetOvp (Uint16 *chnl*, float32 *ovpSetting*)

Sets the over voltage protection limit for the specified channel.

Parameters

in	<i>chnl</i>	Specifies the channel number the setting is to be applied to.
in	<i>ovpSetting</i>	Specifies the value of the limit to be applied (volts).

Returns

Error status.

2.1.2.13 Uint16 adcSetVScale (Uint16 *chnl*, float32 *scaleSetting*)

Sets the voltage scaling for the specified channel.

Parameters

<i>in</i>	<i>chnl</i>	Specifies the channel number the setting is to be applied to.
<i>in</i>	<i>scaleSetting</i>	Specifies the value of the scaling setting to be applied (volts/volts).

Returns

Error status.

2.1.3 Variable Documentation

2.1.3.1 volatile int32* ADCDRV_1ch_Rlt1

Channel 0 current sense ADC terminal pointer.

2.1.3.2 volatile int32* ADCDRV_1ch_Rlt10

Channel 3 voltage sense ADC terminal pointer.

2.1.3.3 volatile int32* ADCDRV_1ch_Rlt11

Interboost voltage sense ADC terminal pointer.

2.1.3.4 volatile int32* ADCDRV_1ch_Rlt12

AC stage voltage sense ADC terminal pointer.

2.1.3.5 volatile int32* ADCDRV_1ch_Rlt13

VMid voltage sense ADC terminal pointer.

2.1.3.6 volatile int32* ADCDRV_1ch_Rlt2

Channel 1 current sense ADC terminal pointer.

2.1.3.7 volatile int32* ADCDRV_1ch_Rlt3

Channel 2 current sense ADC terminal pointer.

2.1.3.8 volatile int32* ADCDRV_1ch_Rlt4

Channel 3 current sense ADC terminal pointer.

2.1.3.9 volatile int32* ADCDRV_1ch_Rlt5

Interboost current sense ADC terminal pointer.

2.1.3.10 volatile int32* ADCDRV_1ch_Rlt6

AC stage current sense ADC terminal pointer.

2.1.3.11 volatile int32* ADCDRV_1ch_Rlt7

Channel 0 voltage sense ADC terminal pointer.

2.1.3.12 volatile int32* ADCDRV_1ch_Rlt8

Channel 1 voltage sense ADC terminal pointer.

2.1.3.13 volatile int32* ADCDRV_1ch_Rlt9

Channel 2 voltage sense ADC terminal pointer.

2.2 BstEn.h File Reference

Functions for enabling and disabling the boost converter stages via I2C.

This graph shows which files directly or indirectly include this file:

Macros

- #define [IOE_I2C_ADDR](#) 0x20
- #define [IOE_IODIR_ADDR](#) 0x00
- #define [IOE_IPOL_ADDR](#) 0x01
- #define [IOE_GPINTEN_ADDR](#) 0x02
- #define [IOE_DEFVAL_ADDR](#) 0x03
- #define [IOE_INTCON_ADDR](#) 0x04

- #define [IOE_GPIO_ADDR](#) 0x09
- #define [IOE_OLAT_ADDR](#) 0x0A
- #define [BST_NUM_CHNL](#) 0x04
- #define [IOE_NUM_CHNL](#) [BST_NUM_CHNL](#)

Functions

- Uint16 [bcInit](#) (void)
- Uint16 [bcEnable](#) (Uint16 chnl)
- Uint16 [bcDisable](#) (Uint16 chnl)

2.2.1 Detailed Description

Functions for enabling and disabling the boost converter stages via I2C. The converters are controlled via an external I/O expander (MCP23008) that is connected to the I2C bus at address 0100x-x-x where 'x-x-x' is dependent upon the configuration of resistors R60 - 61 & R70 - R74.

After [bcInit\(\)](#) all converters default to disabled.

Warning

Before any converter control functions can be used the I2C peripheral MUST be initialised and EITHER [bcInit\(\)](#) or [fclnit\(\)](#) MUST be run - [bcInit\(\)](#) will require the interrupts to be enabled globally.

See Also

[i2cInit\(\)](#)
[fclnit\(\)](#)

2.2.2 Macro Definition Documentation

2.2.2.1 #define BST_NUM_CHNL 0x04

Number of boost converter channels.

2.2.2.2 #define IOE_DEFVAL_ADDR 0x03

MCP23008 I/O expander default value register address.

2.2.2.3 #define IOE_GPINTEN_ADDR 0x02

MCP23008 I/O expander interrupt on change enable register address.

2.2.2.4 #define IOE_GPIO_ADDR 0x09

MCP23008 I/O expander GPIO port register address.

2.2.2.5 #define IOE_GPPU_ADDR 0x06

MCP23008 I/O expander pull-up resistor configuration register address.

2.2.2.6 #define IOE_I2C_ADDR 0x20

MCP23008 I/O expander I2C address (slave, 32d, 8-bit I/O expander).

2.2.2.7 #define IOE_INTCAP_ADDR 0x08

MCP23008 I/O expander interrupt capture register address.

2.2.2.8 #define IOE_INTCON_ADDR 0x04

MCP23008 I/O expander interrupt on change control register address.

2.2.2.9 #define IOE_INTF_ADDR 0x07

MCP23008 I/O expander interrupt flag register address.

2.2.2.10 #define IOE_IOCON_ADDR 0x05

MCP23008 I/O expander configuration register address.

2.2.2.11 #define IOE_IODIR_ADDR 0x00

MCP23008 I/O expander I/O direction register address.

2.2.2.12 #define IOE_IPOL_ADDR 0x01

MCP23008 I/O expander input polarity register address.

2.2.2.13 #define IOE_NUM_CHNL BST_NUM_CHNL

Total number of MCP I/O expander channels.

2.2.2.14 #define IOE_OLAT_ADDR 0x0A

MCP23008 I/O expander output latch register address.

2.2.3 Function Documentation

2.2.3.1 Uint16 bcDisable (Uint16 *chnl*)

Disables the specified channel's boost converter. The I2C peripheral and the boost converter enable controller interface MUST be initialised before this function is used.

See Also

[i2cInit\(\)](#)
[bcInit\(\)](#)

Parameters

<i>in</i>	<i>chnl</i>	Specifies the channel boost that is to be disabled.
-----------	-------------	---

Returns

Error status.

2.2.3.2 Uint16 bcEnable (Uint16 *chnl*)

Enables the specified channel's boost converter. The I2C peripheral and the boost converter enable controller interface MUST be initialised before this function is used.

See Also

[i2cInit\(\)](#)
[bclInit\(\)](#)

Parameters

<code>in</code>	<code>chnl</code>	Specifies the channel boost that is to be enabled.
-----------------	-------------------	--

Returns

Error status.

2.2.3.3 Uint16 bclnit (void)

Initialises the boost converter enable control interface. The I2C peripheral MUST be initialised before this function is used.

See Also

[i2cInit\(\)](#)

Returns

Error status.

2.3 Cntl.h File Reference

DPLib CNTL Macro related helper functions.

2.3.1 Detailed Description

DPLib CNTL Macro related helper functions.

2.3.2 Macro Definition Documentation

2.3.2.1 #define SATMAX_MAX 0.9f

The maximum allowable value for the IIR filter control law's maximum saturation.

2.3.3 Typedef Documentation

2.3.3.1 typedef enum coefNum cfType

A type that allows a reference to a CNTL coefficient.

2.3.4 Enumeration Type Documentation

2.3.4.1 enum coefNum

CNTL Coefficient references

Enumerator

- cMin** Saturation minimum reference.
- cMax** Saturation maximum reference.
- cB0** B0 coefficient reference.
- cB1** B1 coefficient reference.
- cA1** A1 coefficient reference.
- cB2** B2 coefficient reference.
- cA2** A2 coefficient reference.
- cB3** B3 coefficient reference.
- cA3** A3 coefficient reference.

2.3.5 Function Documentation

2.3.5.1 Uint16 cntlGetCoef (Uint16 *chnl*, cfType *coef*, float32 * *valDest*)

Queries the specified IIR filter control law coefficient for the specified channel.

Parameters

in	<i>chnl</i>	Specifies the channel number on which the setting is to be queried.
in	<i>coef</i>	Specifies the coefficient to be queried.
out	<i>valDest</i>	Address of the memory location at which to place the query result.

Returns

Error status.

2.3.5.2 Uint16 cntlSetCoef (Uint16 *chnl*, cfType *coef*, float32 *val*)

Sets the specified IIR filter control law coefficient for the specified channel.

- The actual setting in use is not updated until AFTER [cntlUpdateCoefs\(\)](#) has been called.

Parameters

in	<i>chnl</i>	Specifies the channel number the setting is to be applied to [0, NUM_CHNLS).
in	<i>coef</i>	Specifies the coefficient to be set [cMin, cA3].
in	<i>val</i>	Specifies the coefficient value to be applied. Should be between the minimum and maximum values for the specific coefficient as defined by cfLmts[coef] and cfLmts[coef + cA3].

Returns

Error status.

2.3.5.3 void cntlUpdateCoefs (void)

Updates the IIR filter control law's coefficients that are being used to those values set by the use of the other functions within this file.

2.3.6 Variable Documentation

2.3.6.1 volatile int32* CNTL_2P2Z_Coef1

Channel 0 IIR filter control law coefficient terminal pointer.

2.3.6.2 volatile int32* CNTL_2P2Z_Coef2

Channel 1 IIR filter control law coefficient terminal pointer.

2.3.6.3 volatile int32* CNTL_2P2Z_Coef3

Channel 2 IIR filter control law coefficient terminal pointer.

2.3.6.4 volatile int32* CNTL_2P2Z_Coef4

Channel 3 IIR filter control law coefficient terminal pointer.

2.3.6.5 volatile int32* CNTL_2P2Z_Fdbk1

Channel 0 IIR filter control law feedback terminal pointer.

2.3.6.6 volatile int32* CNTL_2P2Z_Fdbk2

Channel 1 IIR filter control law feedback terminal pointer.

2.3.6.7 volatile int32* CNTL_2P2Z_Fdbk3

Channel 2 IIR filter control law feedback terminal pointer.

2.3.6.8 volatile int32* CNTL_2P2Z_Fdbk4

Channel 3 IIR filter control law feedback terminal pointer.

2.3.6.9 volatile int32* CNTL_2P2Z_Out1

Channel 0 IIR filter control law output terminal pointer.

2.3.6.10 volatile int32* CNTL_2P2Z_Out2

Channel 1 IIR filter control law output terminal pointer.

2.3.6.11 volatile int32* CNTL_2P2Z_Out3

Channel 2 IIR filter control law output terminal pointer.

2.3.6.12 volatile int32* CNTL_2P2Z_Out4

Channel 3 IIR filter control law output terminal pointer.

2.3.6.13 volatile int32* CNTL_2P2Z_Ref1

Channel 0 IIR filter control law reference terminal pointer.

2.3.6.14 volatile int32* CNTL_2P2Z_Ref2

Channel 1 IIR filter control law reference terminal pointer.

2.3.6.15 volatile int32* CNTL_2P2Z_Ref3

Channel 2 IIR filter control law reference terminal pointer.

2.3.6.16 volatile int32* CNTL_2P2Z_Ref4

Channel 3 IIR filter control law reference terminal pointer.

2.3.6.17 volatile int32* CNTL_3P3Z_Coef1

Interboost IIR filter control law coefficient terminal pointer.

2.3.6.18 volatile int32* CNTL_3P3Z_Coef2

AC stage IIR filter control law coefficient terminal pointer.

2.3.6.19 volatile int32* CNTL_3P3Z_Fdbk1

Interboost IIR filter control law feedback terminal pointer.

2.3.6.20 volatile int32* CNTL_3P3Z_Fdbk2

AC stage IIR filter control law feedback terminal pointer.

2.3.6.21 volatile int32* CNTL_3P3Z_Out1

Interboost IIR filter control law output terminal pointer.

2.3.6.22 volatile int32* CNTL_3P3Z_Out2

AC stage IIR filter control law output terminal pointer.

2.3.6.23 volatile int32* CNTL_3P3Z_Ref1

Interboost IIR filter control law reference terminal pointer.

2.3.6.24 volatile int32* CNTL_3P3Z_Ref2

AC stage IIR filter control law reference terminal pointer.

2.3.6.25 struct CNTL_2P2Z_CoefStruct coefs2[NUM_ICTRL_CHNLS]

Array of structures that hold the 2-pole 2-zero IIR filter control law coefficient currently in use.

2.3.6.26 struct CNTL_3P3Z_CoefStruct coefs3[NUM_VCTRL_CHNLS]

Array of structures that hold the 3-pole 3-zero IIR filter control law coefficient currently in use.

2.4 Common.h File Reference

Common include file for the project.

- #define [IOE_OLAT_ADDR](#) 0x0A
- #define [FAN_NUM_CHNL](#) 0x04
- #define [FAN_CHNL_OFST](#) 0x04

Functions

- Uint16 [fcInit](#) (void)
- Uint16 [fcEnable](#) (Uint16 chnl)
- Uint16 [fcDisable](#) (Uint16 chnl)

2.5.1 Detailed Description

Functions for enabling and disabling the external fans via I2C. The fans are controlled via an external I/O expander (MCP23008) that is connected to the I2C bus at address 0100x-x-x where 'x-x-x' is dependent upon the configuration of resistors R60 - 61 & R70 - R74.

After [fcInit\(\)](#) all fans default to disabled.

Warning

Before any fan control functions can be used the I2C peripheral MUST be initialised and EITHER [fcInit\(\)](#) or [bcInit\(\)](#) must be run - [fcInit\(\)](#) will require the interrupts to be enabled globally.

See Also

[i2cInit\(\)](#)
[bclnit\(\)](#)

2.5.2 Macro Definition Documentation

2.5.2.1 #define FAN_CHNL_OFST 0x04

Fan channel numbering offset

2.5.2.2 #define FAN_NUM_CHNL 0x04

Number of fan channels

2.5.2.3 #define IOE_DEFVAL_ADDR 0x03

MCP23008 I/O expander default value register address

2.5.2.4 #define IOE_GPINTEN_ADDR 0x02

MCP23008 I/O expander interrupt on change enable register address

2.5.2.5 #define IOE_GPIO_ADDR 0x09

MCP23008 I/O expander GPIO port register address

2.5.2.6 #define IOE_GPPU_ADDR 0x06

MCP23008 I/O expander pull-up resistor configuration register address

2.5.2.7 #define IOE_I2C_ADDR 0x20

MCP23008 I/O expander I2C address (slave, 32d, 8-bit I/O expander)

2.5.2.8 #define IOE_INTCAP_ADDR 0x08

MCP23008 I/O expander interrupt capture register address

2.5.2.9 #define IOE_INTCON_ADDR 0x04

MCP23008 I/O expander interrupt on change control register address

2.5.2.10 #define IOE_INTF_ADDR 0x07

MCP23008 I/O expander interrupt flag register address

2.5.2.11 #define IOE_IOCON_ADDR 0x05

MCP23008 I/O expander configuration register address

2.5.2.12 #define IOE_IODIR_ADDR 0x00

MCP23008 I/O expander I/O direction register address

2.5.2.13 #define IOE_IPOL_ADDR 0x01

MCP23008 I/O expander input polarity register address

2.5.2.14 #define IOE_OLAT_ADDR 0x0A

MCP23008 I/O expander output latch register address

2.5.3 Function Documentation

2.5.3.1 Uint16 fcDisable (Uint16 *chnl*)

Disables the specified channel's fan The I2C peripheral and the fan enable controller interface MUST be initialised before this function is used.

See Also

[i2cInit\(\)](#)
[fcInit\(\)](#)

Parameters

<i>in</i>	<i>chnl</i>	Specifies the channel fan that is to be disabled
-----------	-------------	--

Returns

Error status

2.5.3.2 Uint16 fcEnable (Uint16 *chnl*)

Enables the specified channel's fan The I2C peripheral and the fan enable controller interface MUST be initialised before this function is used.

See Also

[i2cInit\(\)](#)
[fcInit\(\)](#)

Parameters

<i>in</i>	<i>chnl</i>	Specifies the channel fan that is to be enabled
-----------	-------------	---

Returns

Error status

2.5.3.3 Uint16 fcInit (void)

Initialises the fan enable control interface. The I2C peripheral must be initialised before this function is used.

See Also

[i2cInit\(\)](#)

Returns

Error status

2.6.2 Macro Definition Documentation

2.6.2.1 `#define I2C_ARDY_ISRC 0x0003`

I2C Interrupt Sources Register access ready condition I2C interrupt source.

2.6.2.2 `#define I2C_CLR_AL_BIT 0x0001`

I2C Status Clear Bits Arbitration lost status clear bit.

2.6.2.3 `#define I2C_CLR_ARDY_BIT 0x0004`

Register access ready status clear bit.

2.6.2.4 `#define I2C_CLR_NACK_BIT 0x0002`

NACK status clear bit.

2.6.2.5 `#define I2C_CLR_RRDY_BIT 0x0008`

Receive data ready status clear bit.

2.6.2.6 `#define I2C_CLR_SCD_BIT 0x0020`

Stop detected status clear bit.

2.6.2.7 `#define I2C_MAX_BUFFER_SIZE 0x04`

Maximum I2C message buffer size in bytes, including slave register pointer bytes.

2.6.2.8 #define I2C_MAX_PTR_SIZE 0x02

Maximum number of slave register pointer bytes.

2.6.2.9 #define I2C_MSGSTAT_INACTIVE 0x0000

I2C Message States Inactive I2C message state.

2.6.2.10 #define I2C_MSGSTAT_READ_BUSY 0x0023

State indicating the I2C is busy with a read.

2.6.2.11 #define I2C_MSGSTAT_RESTART 0x0022

Transmit a master read with a restart.

2.6.2.12 #define I2C_MSGSTAT_SEND_NOSTOP 0x0020

Transmit a write with no stop.

2.6.2.13 #define I2C_MSGSTAT_SEND_NOSTOP_BUSY 0x0021

State indicating the I2C is busy with a write with no stop.

2.6.2.14 #define I2C_MSGSTAT_SEND_WITHSTOP 0x0010

Transmit a write with stop I2C message state.

2.6.2.15 #define I2C_MSGSTAT_WRITE_BUSY 0x0011

State indicating the I2C is busy with a write with a stop.

2.6.2.16 #define I2C_SCD_ISRC 0x0006

Stop detected condition I2C interrupt source.

2.6.3 Function Documentation**2.6.3.1 void i2cInit (void)**

Initialises the I2C-A peripheral and relevant interrupts. This function will clear any values already in the I2C peripheral registers. This function **MUST** be called before any other public I2C function.

2.6.3.2 void i2cPopMsg (i2cMsg * msg, Uint16 msgStatus, Uint16 slaveAddr, Uint16 numDataBytes, Uint16 numSlavePtrBytes, Uint16 slavePtrAddrHi, Uint16 slavePtrAddrLo)

This function can be used to validate and populate the specified settings and values into the specified I2C message structure.

Parameters

out	<i>msg</i>	The I2C message structure.
in	<i>msgStatus</i>	The initial I2C message status.
in	<i>slaveAddr</i>	The slave address.
in	<i>numDataBytes</i>	The number, if any, of data bytes, above any slave register pointer bytes, in the message.
in	<i>numSlavePtr-Bytes</i>	The number, if any, of slave register pointer bytes.
in	<i>slavePtrAddrHi</i>	The slave register pointer high byte. If only one byte, or none, (as indicated by numSlavePtrbytes) is to be used leave this at zero.
in	<i>slavePtrAddrLo</i>	The slave register pointer low byte. If no pointer bytes (as indicated by num-SlavePtrbytes) are used leave this at zero.

2.6.3.3 Uint16 i2cRead (i2cMsg * *msg*)

Starts an I2C-Aread using the settings specified. Read bytes are saved to the buffer msg.msgBuffer[].

Parameters

in	<i>msg</i>	The I2C message struct.
----	------------	-------------------------

Returns

Error status.

2.6.3.4 Uint16 i2cWrite (i2cMsg * *msg*)

Starts an I2C-A write using the settings and values specified.

Parameters

in	<i>msg</i>	The I2C message structure.
----	------------	----------------------------

Returns

Error Status.

2.7.1 Detailed Description

DPLib macro net and value control functions.

2.7.2 Macro Definition Documentation

2.7.2.1 `#define AC_I_CNTL 4`

The index position for AC I control settings.

2.7.2.2 `#define AC_STAGE 6`

The index position for AC stage settings.

2.7.2.3 `#define DC_STAGE 5`

The index position for DC stage settings.

2.7.2.4 `#define LOAD_0 0`

The index position for Load 0 settings.

2.7.2.5 `#define LOAD_1 1`

The index position for Load 1 settings.

2.7.2.6 `#define LOAD_2 2`

The index position for Load 2 settings.

2.7.2.7 `#define LOAD_3 3`

The index position for Load 3 settings.

2.7.2.8 `#define V_MID_CH 7`

The index position for VMid settings.

2.7.3 Typedef Documentation

2.7.3.1 `typedef enum iOrVCtl ctlType`

A type that allow specification of a channel's control mode setting.

2.7.3.2 `typedef enum acOrDc opType`

A type that allow specification of a channel's output mode setting.

2.7.4 Enumeration Type Documentation

2.7.4.1 enum acOrDc

The possible settings for channel output settings.

Enumerator

- dc** DC channel setting (0).
- ac** AC channel setting (1 or not-zero).

2.7.4.2 enum iOrVctl

The possible settings for channel control setting.

Enumerator

- iCtrl** Current control setting (0).
- vCtrl** Voltage control setting (1 or not-zero).

2.7.5 Function Documentation

2.7.5.1 void mnConnectNets (void)

Connects the macro terminals to the relevant nets. This SHOULD be called AFTER DPL_Init()

2.7.5.2 void mnRunAll (void)

Enables all IIR filter control law reference inputs.

2.7.5.3 void mnSetupChannels (void)

Initialises all channel settings structures with their default values.

Warning

This MUST be called AFTER [pwmMacroConfigure\(\)](#)

2.7.5.4 void mnStopAll (void)

Disables and zeros all IIR filter control law reference inputs, thus causing their outputs to ramp down to zero.

2.7.6 Variable Documentation

2.7.6.1 channelParameters channel[NUM_CHNLS+1]

A collection of the individual channel structures.

2.7.6.2 Uint16 enableAll

Enable-all condition flag that allows status communication between the state machine tasks.

2.7.6.3 Uint16 stopAll

Stop-all condition flag that allows status communication between the state machine tasks.

2.8 PhaseCtrl.h File Reference

Signal generator phase (ACFBPHASE) control function.

This graph shows which files directly or indirectly include this file:

Functions

- void [pcUpdate](#) (void)

Variables

- volatile int32 * [PHASE_CTRL_In](#)

2.8.1 Detailed Description

Signal generator phase (ACFBPHASE) control function.

Warning

This file is included by the file ISR.asm and thus any dependencies this file has should also be included there (e.g. PeripheralHeaderIncludes.h).

2.8.2 Function Documentation

2.8.2.1 void pcUpdate (void)

Updates GPIO19 based on state of *PHASE_CTRL_In terminal. Expects 0 (GPIO19 set) or non-zero (GPIO19 cleared). This is generally called by the DPL_ISR.asm

2.8.3 Variable Documentation

2.8.3.1 volatile int32* PHASE_CTRL_In

Phase control module signal input terminal.

2.9 Pwm.h File Reference

PWM and related functions.

This graph shows which files directly or indirectly include this file:

Macros

- `#define prd 600`

Functions

- void `pwmTzConfigure` (void)
- void `pwmRstTz` (void)
- void `pwmMacroConfigure` (void)
- void `pwmSocConfigure` (void)
- void `pwmDPLTrigInit` (void)
- Uint16 `pwmSetFreq` (Uint16 frq)
- Uint16 `pwmGetFreq` (Uint16 *frqDest)

Variables

- volatile int32 * `PWMDRV_2ch_UpCnt_Duty1A`
- volatile int32 * `PWMDRV_2ch_UpCnt_Duty1B`
- volatile int32 * `PWMDRV_2ch_UpCnt_Duty2A`
- volatile int32 * `PWMDRV_2ch_UpCnt_Duty2B`
- volatile int32 * `PWMDRV_2ch_UpCnt_Duty3A`
- volatile int32 * `PWMDRV_2ch_UpCnt_Duty3B`

2.9.1 Detailed Description

PWM and related functions.

2.9.2 Macro Definition Documentation

2.9.2.1 `#define prd 600`

Defines the initial PWM period setting = 60MHz / 600 = 100.

2.9.3 Function Documentation

2.9.3.1 void pwmDPLTrigInit (void)

Initialises and enables PWM1 (master) to trigger the DPL ISR.

2.9.3.2 Uint16 pwmGetFreq (Uint16 * *freqDest*)

Queries the current PWM frequency setting.

Parameters

out	<i>freqDest</i>	Address of the memory location at which to place the query result (hertz).
-----	-----------------	--

Returns

Error status.

2.9.3.3 void pwmMacroConfigure (void)

Configures each of the PWM macros for use.

2.9.3.4 void pwmRstTz (void)

Resets the trip zone after a comparator event.

2.9.3.5 Uint16 pwmSetFreq (Uint16 *freq*)

Sets the frequency of the PWMs.

Parameters

in	<i>freq</i>	Specifies the required frequency (hertz).
----	-------------	---

Returns

Error status.

2.9.3.6 void pwmSocConfigure (void)

Configures PWM1 (master) to generate ADC SOC start for ADC macro - configure before initialisation.

2.9.3.7 void pwmTzConfigure (void)

Configures PWM trip zones for use. Requires the comparator and DAC to be configured

See Also

[adc.h](#)

2.9.4 Variable Documentation

2.9.4.1 volatile int32* PWMDRV_2ch_UpCnt_Duty1A

Channel 0 PWM terminal pointer.

2.9.4.2 volatile int32* PWMDRV_2ch_UpCnt_Duty1B

Channel 1 PWM terminal pointers.

2.9.4.3 volatile int32* PWMDRV_2ch_UpCnt_Duty2A

Channel 2 PWM terminal pointer.

2.9.4.4 volatile int32* PWMDRV_2ch_UpCnt_Duty2B

Channel 3 PWM terminal pointer.

2.9.4.5 volatile int32* PWMDRV_2ch_UpCnt_Duty3A

Interboost PWM terminal pointer.

2.9.4.6 volatile int32* PWMDRV_2ch_UpCnt_Duty3B

AC stage PWM terminal pointer.

2.10 Settings.h File Reference

Major build definitions and settings for the project.

2.10.1 Detailed Description

Major build definitions and settings for the project.

Warning

This file is included and referenced by ISR.asm, main() and [mnConnectNets\(\)](#).
When changes are made to this file please use rebuild all.

2.10.2 Macro Definition Documentation

2.10.2.1 #define CHANNEL_OOB 0x10

Channel out of bounds error code.

2.10.2.2 #define DEBUG

Includes and makes functions and variables public that are used only for debugging purposes.

2.10.2.3 #define I2C_BUS_BUSY 0x23

I2C bus already busy error code.

2.10.2.4 #define I2C_INVALID_ISRC 0x24

Invalid I2C interrupt source error code.

2.10.2.5 #define I2C_READ_WRONG_MSG 0x20

Incorrect type I2C message read error code.

2.10.2.6 #define I2C_STP_NOT_READY 0x22

I2C stop bit was not yet received error code.

2.10.2.7 #define I2C_WRITE_WRONG_MSG 0x21

Incorrect type I2C write message error code.

2.10.2.8 #define INCR_BUILD 2

Alters the digital power control loop between closed or open. Open-Loop: 1. Closed-loop: 2.

2.10.2.9 #define NUM_CHNLS NUM_ICTRL_CHNLS + NUM_VCTRL_CHNLS

Total number of IIR filter control law macros used (doesn't include VMID semi-channel).

2.10.2.10 #define NUM_ICTRL_CHNLS 5

The number of current, or 2-pole 2-zero, IIR filter control law macros used.

2.10.2.11 #define NUM_VCTRL_CHNLS 2

The number of voltage, or 3-pole 3-zero, IIR filter control law macros used.

2.10.2.12 #define OCP_TRIP 0x12

Over-current protection trip error code.

2.10.2.13 #define OTP_TRIP 0x14

Over-temperature protection trip error code.

2.10.2.14 #define OVP_TRIP 0x13

Over-voltage protection trip error code.

2.10.2.15 #define RECP_SQRT_2 0.70711

1/sqrt(2) constant used for RMS calculations.

2.10.2.16 #define SQRT_2 1.41429

Sqrt(2) constant used for RMS calculations.

2.10.2.17 #define TEST_TZ

Enables trip zone testing code.

2.10.2.18 #define USE_PID

Uses PID gain arrays to set IIR filter control law coefficients instead of the coefficient arrays/ If un-defined 3P3Z's will need to be used in asm files, where relevant/

2.10.2.19 #define uSec100 6000

100us - System define.

2.10.2.20 #define VAC_R1 540.0

Scaling voltage divider R1 resistor value for VAC ADC.

2.10.2.21 #define VAC_R2 4.3

Scaling voltage divider R2 resistor value for VAC ADC.

2.10.2.22 #define VALUE_OOB 0x11

Value out of bounds error code.

2.10.2.23 #define VDDA 3300I

System VMAXREF (millivolts).

2.10.2.24 #define VMID_R1 540.0

Scaling voltage divider R1 resistor value for VMID ADC.

2.10.2.25 #define VMID_R2 4.3

Scaling voltage divider R2 resistor value for VMID ADC.

2.10.2.26 #define VSSA 0I

System VLOWREF (millivolts).

2.11 SineGen.h File Reference

Signal generator functions.

- volatile int32 * `SGENTI_1ch_Sign`

2.11.1 Detailed Description

Signal generator functions. [sgInit\(\)](#) must be called before any other signal generator functions are used. Note that the frequency resolution is determined by the maximum frequency and the step max. For further details, see the signal generator library documentation (Texas Instruments Signal Generator Library Module user's Guide).

Warning

This file is included by the file ISR.asm.

2.11.2 Macro Definition Documentation

2.11.2.1 `#define SIN_CHANNEL AC_STAGE`

Defines which channel enable controls the generator output.

2.11.2.2 `#define SIN_DFLT_F 50.0`

Initial frequency setting (hertz).

2.11.2.3 `#define SIN_DFLT_F_MAX 1000u`

Initial maximum frequency setting (hertz).

2.11.2.4 `#define SIN_DFLT_GAIN 0.9`

Initial gain setting [0.0, 1.0).

2.11.2.5 `#define SIN_DFLT_OFST 0`

Initial offset setting [-0.5, +0.5), IQ15.

2.11.2.6 `#define SIN_DFLT_PHSE 0`

Initial initial phase setting [0, 360), IQ16.

2.11.2.7 `#define SIN_DFLT_RCTFY TRUE`

Initial rectification setting [TRUE | FALSE).

2.11.2.8 `#define SIN_F_SPL 8250u`

Signal sampling frequency, i.e. the frequency that `sgen.calc()` is called at. This is dependent on ISR frequency, currently 1/4 of `f_ISR`, full ISR speed is 33,000Hz.

2.11.3 Function Documentation

2.11.3.1 `void sgGainUpdate (void)`

Updates the gain value to create a slow-start ramp. This should be called at the same time and similarly to the DC slew update.

See Also

[scSlewUpdate\(\)](#)**2.11.3.2 Uint16 sgGetFreq (float32 * *frqDest*)**

Queries the current frequency setting.

Parameters

<i>out</i>	<i>frqDest</i>	Address of the memory location at which to place the query result (hertz).
------------	----------------	--

Returns

Error status.

2.11.3.3 Uint16 sgGetGainTarget (float32 * *gntDest*)

Queries the current target gain setting.

Parameters

<i>out</i>	<i>gntDest</i>	Address of the memory location at which to place the query result.
------------	----------------	--

Returns

Error status.

2.11.3.4 Uint16 sgGetOffset (float32 * *oftDest*)

Queries the current signal DC offset setting.

Parameters

<i>out</i>	<i>oftDest</i>	Address of the memory location at which to place the query result.
------------	----------------	--

Returns

Error status.

2.11.3.5 Uint16 sgGetRectify (Uint16 * *rfyDest*)

Queries the current state of the signal generator rectification enable.

Parameters

<i>out</i>	<i>rfyDest</i>	Address of the memory location at which to place the query result (1:ON 0:OFF).
------------	----------------	---

Returns

Error status.

2.11.3.6 `Uint16 sgGetResolution (float32 * rsIDest)`

Queries the current frequency resolution. This is equal to $f_{max} / \text{step_max}$.

Parameters

<code>out</code>	<code><i>rsIDest</i></code>	Address of the memory location at which to place the query result.
------------------	-----------------------------	--

Returns

Error status.

2.11.3.7 `Uint16 sgGetStepMax (Uint16 * sMxDest)`

Queries the current `step_max` setting.

Parameters

<code>out</code>	<code><i>sMxDest</i></code>	Address of the memory location at which to place the query result.
------------------	-----------------------------	--

Returns

Error status.

2.11.3.8 `void sgInit (void)`

Sets the initial generator values and disables the output. This function **MUST** be called before any other signal generator function.

2.11.3.9 `Uint16 sgSetFMax (Uint16 frq)`

Sets the signal generator maximum frequency setting value, f_{max} .

Parameters

<code>in</code>	<code><i>frq</i></code>	Frequency value $[0, f_{sample})$ (hertz).
-----------------	-------------------------	--

Returns

Error status.

2.11.3.10 `Uint16 sgSetFreq (Uint16 frq)`

Sets the signal frequency.

Parameters

<code>in</code>	<code><i>frq</i></code>	Frequency value $[0, f_{max})$ (hertz).
-----------------	-------------------------	---

Returns

Error status.

2.11.3.11 Uint16 sgSetGainTarget (float32 *gnt*)

Sets the target gain of the signal.

Parameters

<i>in</i>	<i>gnt</i>	Gain target value [0.0, 1.0).
-----------	------------	-------------------------------

Returns

Error status.

2.11.3.12 Uint16 sgSetOffset (float32 *ofst*)

Sets the signal DC offset

Parameters

<i>in</i>	<i>ofst</i>	DC offset value [-0.5, +0.5).
-----------	-------------	-------------------------------

Returns

Error status.

2.11.3.13 Uint16 sgSetPhase (float32 *phs*)

Sets the signal initial phase value

Parameters

<i>in</i>	<i>phs</i>	Initial phase value [0, 360) (degrees).
-----------	------------	---

Returns

Error status

2.11.3.14 Uint16 sgSetRectify (Uint16 *rly*)

Enables or disables the rectification of the generator output

Parameters

<i>in</i>	<i>rly</i>	Rectification enable state (1:ON 0:OFF).
-----------	------------	--

Returns

Error status.

2.11.3.15 void sgSetState (Uint16 *stt*)

Enables or disables the output of the generator onto the connected net

Parameters

<i>in</i>	<i>stt</i>	Output enable state (1:ON 0:OFF).
-----------	------------	-------------------------------------

2.11.3.16 Uint16 sgSetStepMax (Uint16 *sMx*)

Sets the signal generator step max setting value.

Parameters

<i>in</i>	<i>sMx</i>	Step_max value [0, 32767).
-----------	------------	----------------------------

Returns

Error status.

2.11.3.17 void sgUpdate (void)

Generates the next signal data point and loads it onto the VOut terminal. If the point is positive the sign terminal is set, otherwise it is cleared. If rectify is enabled, the value produced will be an absolute value.

2.11.4 Variable Documentation

2.11.4.1 volatile int32* SGENTI_1ch_Sign

Voltage sign (pre-rectification) output terminal.

2.11.4.2 volatile int32* SGENTI_1ch_VOut

Voltage output terminal.

2.12 SlewControl.h File Reference

Slew control functions.

This graph shows which files directly or indirectly include this file:

Functions

- void [scSlewUpdate](#) (void)
- Uint16 [scSetTarget](#) (Uint16 chnl, float32 trgt)
- Uint16 [scSetStep](#) (Uint16 chnl, float32 stp)
- Uint16 [scSetState](#) (Uint16 chnl, Uint16 stt)
- Uint16 [scSetTargetAll](#) (float32 trgt)
- Uint16 [scSetStepAll](#) (float32 stp)
- void [scSetStateAll](#) (Uint16 stt)
- Uint16 [scGetTarget](#) (Uint16 chnl, float32 *trgtDest)
- Uint16 [scGetStep](#) (Uint16 chnl, float32 *stpDest)
- Uint16 [scGetState](#) (Uint16 chnl, Uint16 *sttDest)

2.12.1 Detailed Description

Slew control functions.

2.12.2 Function Documentation

2.12.2.1 Uint16 scGetState (Uint16 *chnl*, Uint16 * *sttDest*)

Queries the current reference net enable state for the specified channel.

Parameters

in	<i>chnl</i>	Specifies the channel the setting is to be read from.
out	<i>sttDest</i>	Address of the memory location at which to place the query result (0:OFF non-zero:ON).

Returns

Error status.

2.12.2.2 Uint16 scGetStep (Uint16 *chnl*, float32 * *stpDest*)

Queries the current slew step size of the specified channel.

Parameters

in	<i>chnl</i>	Specifies the channel the setting is to be read from.
out	<i>stpDest</i>	Address of the memory location at which to place the query result (amps or volts).

Returns

Error status.

2.12.2.3 Uint16 scGetTarget (Uint16 *chnl*, float32 * *trgtDest*)

Queries the current slew target setting for the specified channel.

Parameters

in	<i>chnl</i>	Specifies the channel the setting is to be read from.
out	<i>trgtDest</i>	Address of the memory location at which to place the query result (amps or volts).

Returns

Error status.

2.12.2.4 Uint16 scSetState (Uint16 *chnl*, Uint16 *stt*)

Sets the reference net enable state for the specified channel.

Parameters

in	<i>chnl</i>	Specifies the channel the setting is to be applied to.
in	<i>stt</i>	Specifies the reference net state to be applied (0:OFF non-zero:ON).

Returns

Error Status.

2.12.2.5 void scSetStateAll (Uint16 *stt*)

Sets all channels' reference net enable state.

Parameters

in	<i>stt</i>	Specifies the reference net state to be applied (0:OFF non-zero:ON).
----	------------	--

2.12.2.6 Uint16 scSetStep (Uint16 *chnl*, float32 *stp*)

Sets the slew step size for the specified channel.

Parameters

in	<i>chnl</i>	Specifies the channel the setting is to be applied to.
in	<i>stp</i>	Specifies the value of the slew step size to be applied (amps or volts).

Returns

Error status.

2.12.2.7 Uint16 scSetStepAll (float32 *stp*)

Sets all channels' slew step size.

Parameters

in	<i>stp</i>	Specifies the value of the slew step size to be applied (amps or volts).
----	------------	--

Returns

Error status.

2.12.2.8 Uint16 scSetTarget (Uint16 *chnl*, float32 *trgt*)

Sets the slew target for the specified channel.

Parameters

<i>in</i>	<i>chnl</i>	Specifies the channel the setting is to be applied to.
<i>in</i>	<i>trgt</i>	Specifies the value of the slew target to be applied (amps or volts).

Returns

Error status.

2.12.2.9 Uint16 scSetTargetAll (float32 *trgt*)

Sets all channels' slew target

Parameters

<i>in</i>	<i>trgt</i>	Specifies the value of the slew target to be applied (amps or volts).
-----------	-------------	---

Returns

Error status.

2.12.2.10 void scSlewUpdate (void)

Advances the slew ramps for all relevant channels. Does not apply to channels that use sine references

2.13 StateMachine.h File Reference

State machine functions.

This graph shows which files directly or indirectly include this file:

Functions

- void [smlnit](#) (void)

Variables

- void(* [Alpha_State_Ptr](#))(void)

2.13.1 Detailed Description

State machine functions.

2.13.2 Function Documentation

2.13.2.1 void smlnit (void)

Sets up the state machine (incl. timers) ready for use.

2.13.3 Variable Documentation

2.13.3.1 void(* Alpha_State_Ptr)(void)

Runs the next iteration of the state machine. Should be called from the main super-loop.

2.14 Timers.h File Reference

Real and virtual timer functions.

This graph shows which files directly or indirectly include this file:

Functions

- void [timersSetupVirtual](#) (void)
- void [timersSetupReal](#) (void)

Variables

- int16 [VTimer0](#) [4]
- int16 [VTimer1](#) [4]
- int16 [VTimer2](#) [4]

2.14.1 Detailed Description

Real and virtual timer functions. These functions should be run as part of the state machine setup.

See Also

[StateMachine.h](#)

2.14.2 Function Documentation

2.14.2.1 void timersSetupReal (void)

Sets up the real timers that run the state machine This should be called as part of the state machine initialisation.

See Also

[smlInit\(\)](#)

2.14.2.2 void timersSetupVirtual (void)

Sets up the virtual timers for use in the state machine. This should be called as part of the state machine initialisation and before the real timers are setup.

See Also

[smlInit\(\)](#)

2.14.3 Variable Documentation

2.14.3.1 int16 VTimer0[4]

First set of virtual timers.

2.14.3.2 int16 VTimer1[4]

Second set of virtual timers.

2.14.3.3 int16 VTimer2[4]

Third set of virtual timers.

2.15 Tmp.h File Reference

Temperature sensor functions.

This graph shows which files directly or indirectly include this file:

Macros

- #define [ADC_I2C_ADDR](#) 0x48
- #define [ADC_NUM_CHNL](#) 0x08
- #define [ADC_VREF](#) 5.0
- #define [ADC_STPS](#) 256
- #define [TMP_V0C_OFST](#) 0.4
- #define [TMP_SCL_OFST](#) $\text{TMP_V0C_OFST} * \text{ADC_STPS} / \text{ADC_VREF}$
- #define [TMP_E_T_COLD](#) 1.5

Functions

- Uint16 [tmpInit](#) (void)
- Uint16 [tmpSetOtp](#) (Uint16 chnl, float32 tmp)
- Uint16 [tmpGetOtp](#) (Uint16 chnl, float32 *tmpDest)
- Uint16 [tmpCheckOtp](#) (void)
- Uint16 [tmpRead](#) (Uint16 chnl, float32 *tmpDest)

2.15.1 Detailed Description

Temperature sensor functions. The temperature sensor (MCP9701) output is read via an external ADC (ADS7830) that is connected to the I2C bus at address 10010xx where 'xx' is dependent upon the configuration of resistors R75 - R78. All temperatures are in degrees Celcius.

Warning

Before any temperature functions can be used the I2C peripheral MUST be initialised and [tmpInit\(\)](#) must be run - [tmpInit\(\)](#) will require the interrupts to be enabled globally.

See Also

[i2cInit\(\)](#)

2.15.2 Macro Definition Documentation

2.15.2.1 #define ADC_I2C_ADDR 0x48

Slave I2C address (ADS7830 8-channel ADC - A0 = 0, A1 = 0).

2.15.2.2 `#define ADC_NUM_CHNL 0x08`

Number of temperature channels. The program expects a 50/50 split with first half for the on-board temperature channels.

2.15.2.3 `#define ADC_STPS 256`

Number of ADS7830 ADC steps.

2.15.2.4 `#define ADC_VREF 5.0`

ADS7830 ADC reference voltage (volts).

2.15.2.5 `#define TMP_E_T_COLD 1.5`

MCP9701 Error at lowest operating temperature (° C), calculated as shown in Microchip AN1001.

2.15.2.6 `#define TMP_SCL_OFST TMP_V0C_OFST * ADC_STPS / ADC_VREF`

Scaled temperature offset.

2.15.2.7 `#define TMP_V0C_OFST 0.4`

MCP9701 Temperature sensor $V_{0^{\circ}C}$ (volts).

2.15.3 Function Documentation

2.15.3.1 `Uint16 tmpCheckOtp (void)`

Tests the current on-board temperature sensor readings against the OTP limits.

Returns

Error status.

2.15.3.2 `Uint16 tmpGetOtp (Uint16 chnl, float32 * tmpDest)`

Queries the on-board over temperature limit for the specified channel. The I2C peripheral and temperature reading interface MUST be initialised before this function is used.

Parameters

in	<i>chnl</i>	Specifies the channel the setting is to be read from.
out	<i>tmpDest</i>	Address of the memory location at which to place the query result (° C).

Returns

Error status.

2.15.3.3 `Uint16 tmpInit (void)`

Initialises the system for temperature readings. The I2C peripheral must be initialised before this function is used

See Also

[i2cInit\(\)](#).

Returns

Error status.

2.15.3.4 `Uint16 tmpRead (Uint16 chnl, float32 * tmpDest)`

Queries the current on-board temperature of the specified channel.

Parameters

<code>in</code>	<code><i>chnl</i></code>	Specifies the channel the temperature is to be read from.
<code>out</code>	<code><i>tmpDest</i></code>	Address of the memory location at which to place the query result (° C).

Returns

Error status.

2.15.3.5 `Uint16 tmpSetOtp (Uint16 chnl, float32 tmp)`

Sets the on-board over temperature limit for the specified channel. The I2C peripheral and temperature reading interface MUST be initialised before this function is used.

Parameters

<code>in</code>	<code><i>chnl</i></code>	Specifies the channel the setting is to be applied to.
<code>in</code>	<code><i>tmp</i></code>	Specifies the value of the limit to be applied (° C).

Returns

Error status.
